UNAT
Ultra-small Nanohybrides for Advanced Theranostics

BIOEMTECH

Radiolabeling and imaging approaches for carbon-based nanohybrids

Antonis Skliris

Nanohybrides 18 – Bastia May-June 2022

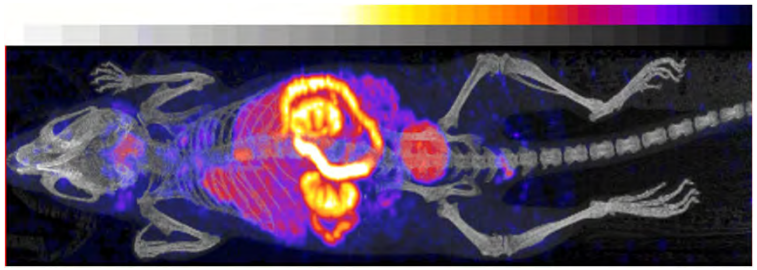
Who we are ?

BIOEMTECH

BIOEMTECH is a SME who develops and offers innovative solutions in medical and pharmaceutical research in the **non-invasive *in vivo* imaging.**

We focus on **molecular imaging** and **biomedical engineering**:

- ✓ Design and construction of low-cost benchtop imaging devices
- ✓ Performance of preclinical imaging services in our imaging platform
- ✓ Computational simulations using Monte Carlo techniques



BioEmission Technology Solutions
Lefkippos Attica Technology Park – N.C.S.R Demokritos, Greece • Tel: +302130290586 • info@bioemtech.com • www.bioemtech.com

BIOEMTECH Labs

BIOEMTECH

- R&D labs at the Technology Park "**Lefkippos**" in **NCSR Demokritos** since 2017.

BIOEMTECH | Labs

In-vitro Lab

In vitro testing (targeting, cytotoxicity, etc.)

Radiochemistry Lab

Radiolabeling of compounds & QC

Animal Hosting

Mouse models (oncology, etc.)

In-vivo Imaging Lab

2D/3D, static or dynamic PET/SPECT/CT imaging

Nanotechnology

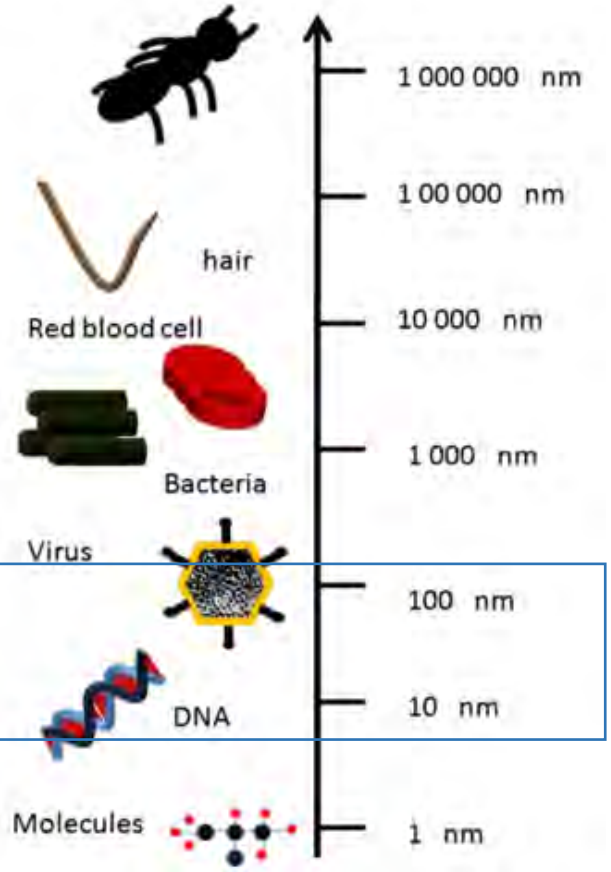
BIOEMTECH

Nanoparticles

Structures where AT LEAST one dimension is between 1 and 100 nm (sometimes may be bigger)

Nanoscale

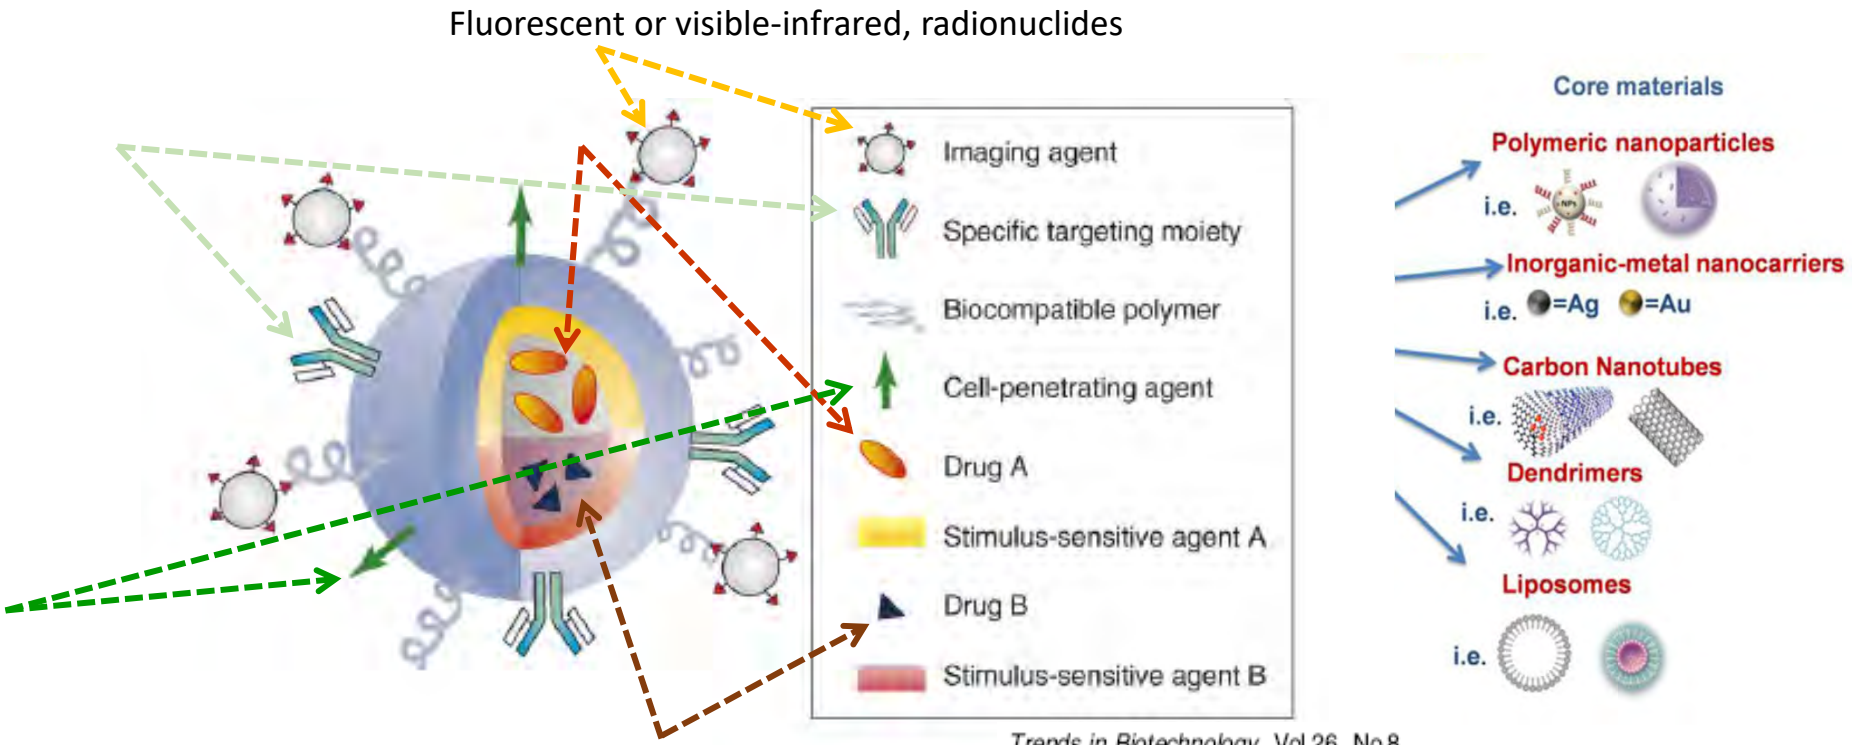
- Human: 1,800,000,000 nm
- Insect: 1,000,000 nm
- Hair: ~ 10,000 nm
- Blood cell: 8,000 nm
- Bacteria: eColi 2,000 nm
- Virus: 100 nm
- Protein: ~1-20 nm
- Molecule: ~1nm
- Hydrogen atom: 0.04 nm



BioEmission Technology Solutions
Lefkippos Attica Technology Park – N.C.S.R Demokritos, Greece • Tel: +302130290586 • info@bioemtech.com • www.bioemtech.com

Multifunctional nanomaterials

BIOEMTECH



Trends in Biotechnology Vol.26 No.8

Advantages:

- Selected tumor/organ targeting;
- Low drug concentration in normal tissues
- Controlled drug release in target tumor/organ
- Minimization of side effects due to lower dose and targeted delivery

BIOEMTECH Labs

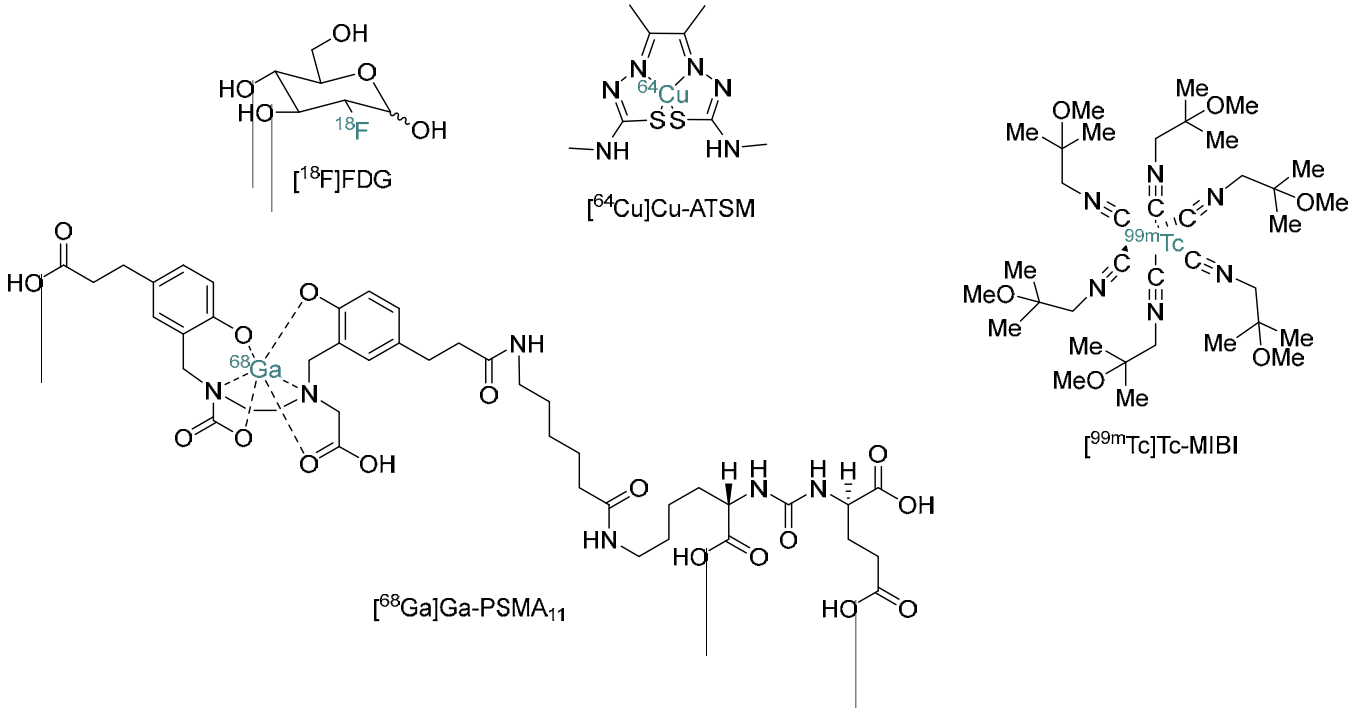
BIOEMTECH

Radiolabeling of compounds & QC

Labelling approaches

BIOEMTECH

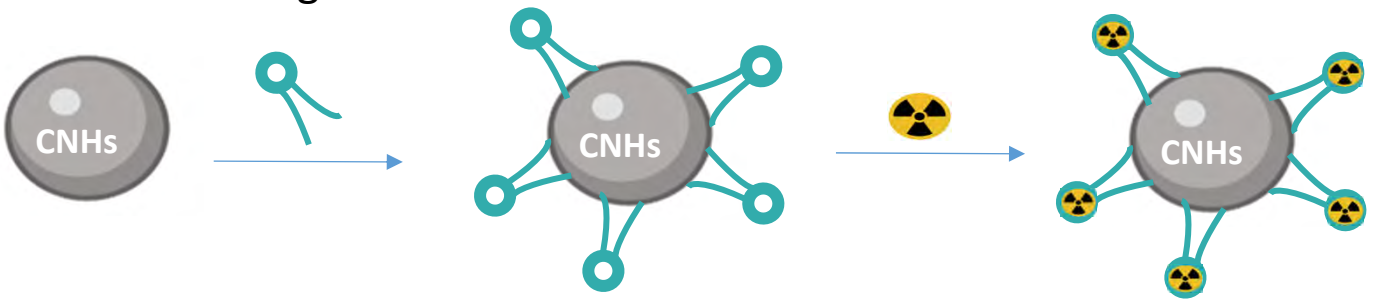
Metallic Isotopes: Use of precursors that chelate the radiometal, transmetallation reactions
Non-metallic isotopes: Use of organic chemistry reactions (SN, SN_2, SN_{Ar}, click reactions)



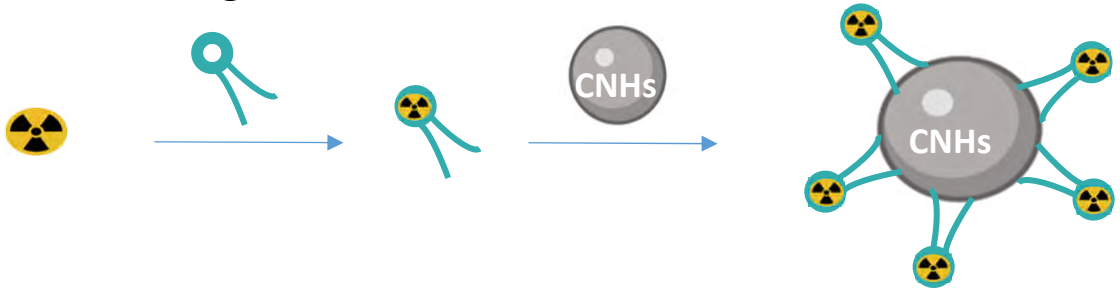
Radiolabelling approaches

BIOEMTECH

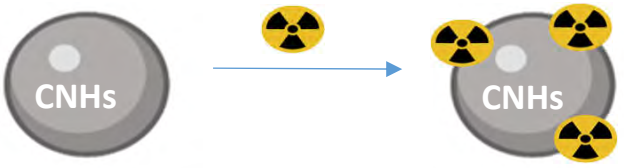
Post-radiolabeling



Pre-radiolabeling



Direct radiolabeling (no chelator)



Perform QC
Calculation of the
radiochemical conversion

Stockhofe et al. ,Pharmaceuticals 2014;7, 392-418

Types of radioisotopes

BIOEMTECH

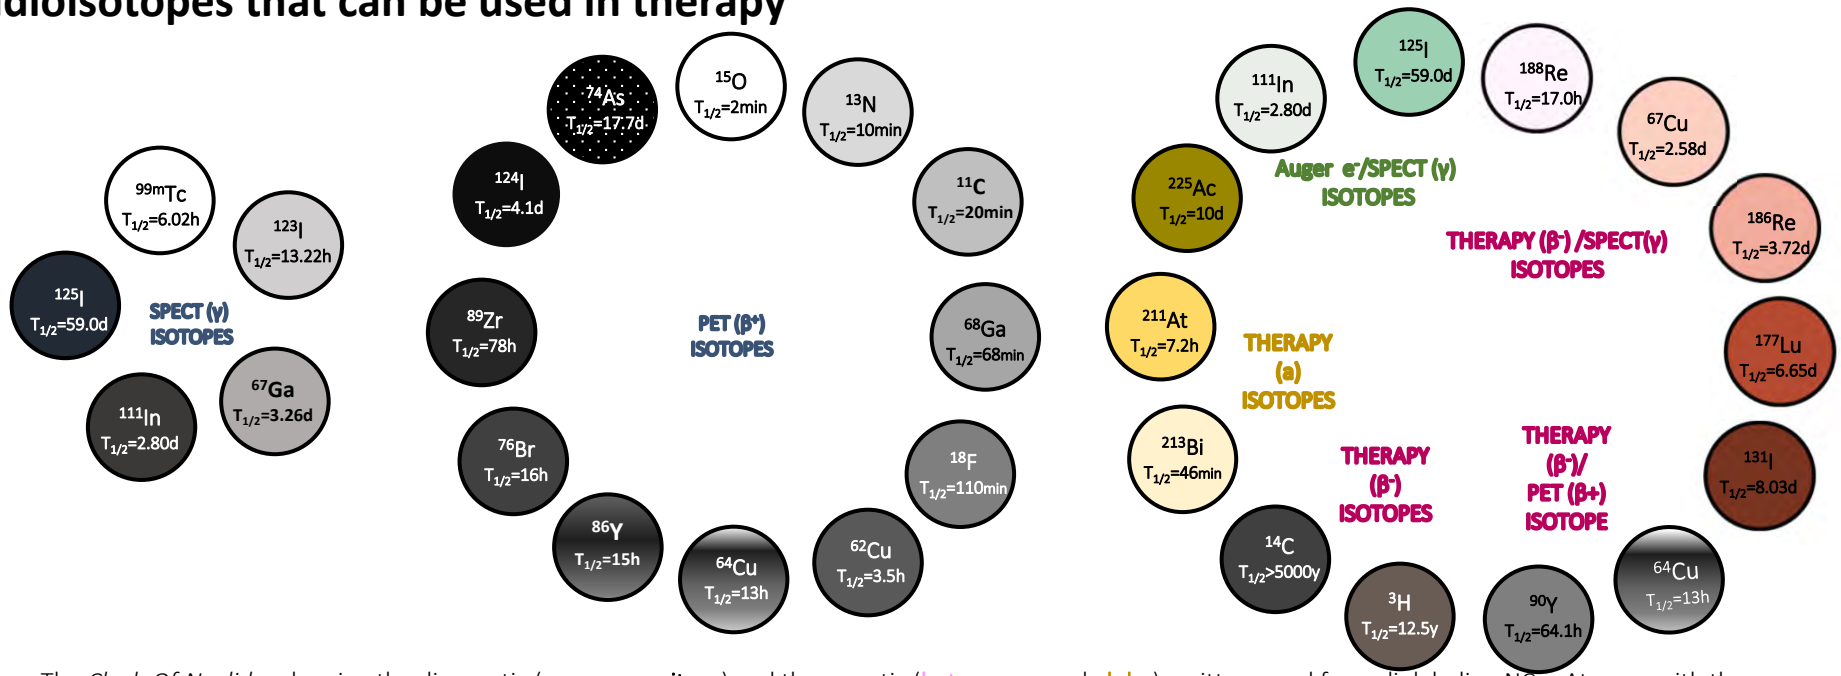
Long lived isotopes and Short lived isotopes

In medicine we usually use short-lived isotopes

Metallic radioisotopes and non metallic radioisotopes

ex. Metallic: technetium-99m gallium-68, copper-64 and zirconium-89; Non-metallic: carbon-11, fluorine-18

Radioisotopes that can be used in therapy

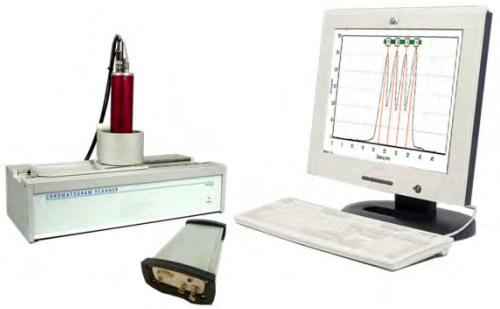


The *Clock-Of-Nuclides* showing the diagnostic (gamma, positron) and therapeutic (beta, auger and alpha) emitters used for radiolabeling NCs. At noon with the shortest physical half-life and ending with the longest physical half-life.

Analytical techniques

BIOEMTECH

Radio-TLC



Radio-HPLC

γ-counter

Measures: the percentage of the incorporated radioisotope.
It is used: synthesis, stability tests

Measures: the activity per sample
It is used: metabolite analysis, tracer kinetic studies *in vitro*, and pre-clinical biodistribution studies

Scintillator detectors

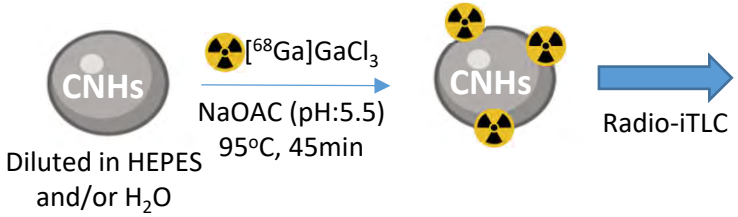
QC of radiolabeled CNHs

BIOEMTECH

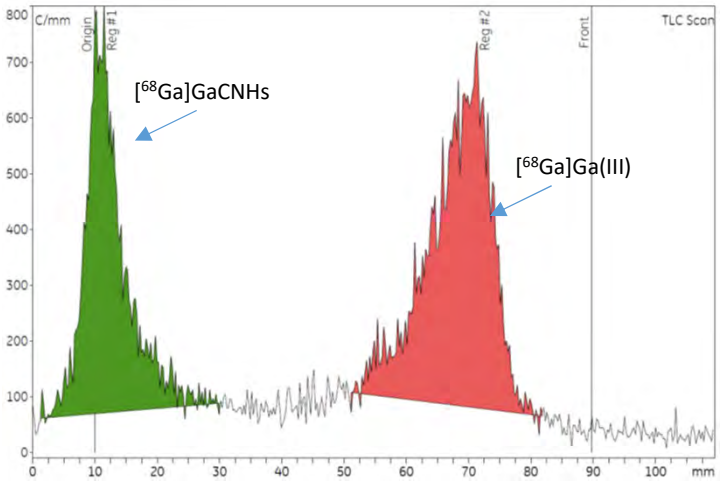
Why ? to ensure necessary chemical functionalization of the NHs for their successful in-vivo introduction

- Radiolabeling of different carbon nanohybrids (CNHs) received from the partners with [^{68}Ga]Ga(III) for PET imaging.

Nanomaterials tested	
CFO	carbon fluorooxide
CD3011	carbon nanodots
CDF19	carbon nanodots
S2	carbon nanodots

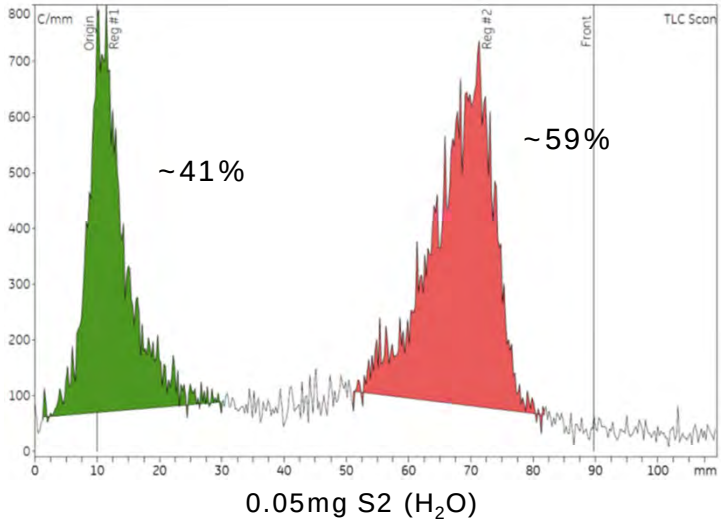


Whatman 3 MM, 0.1M EDTA

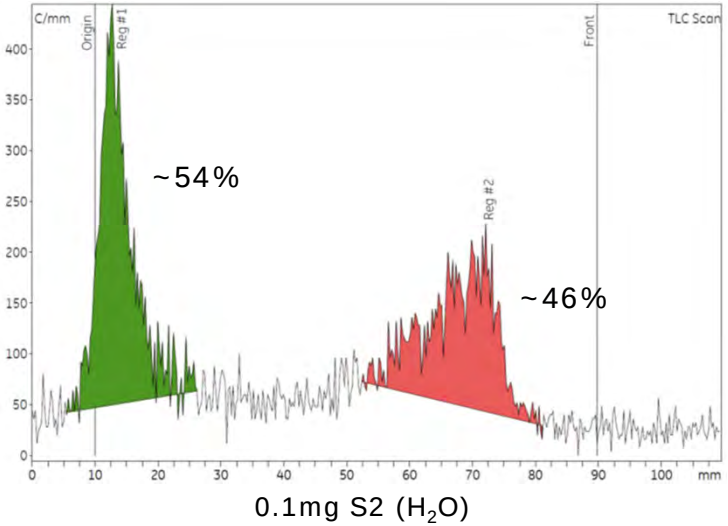


QC of radiolabeled CNHs

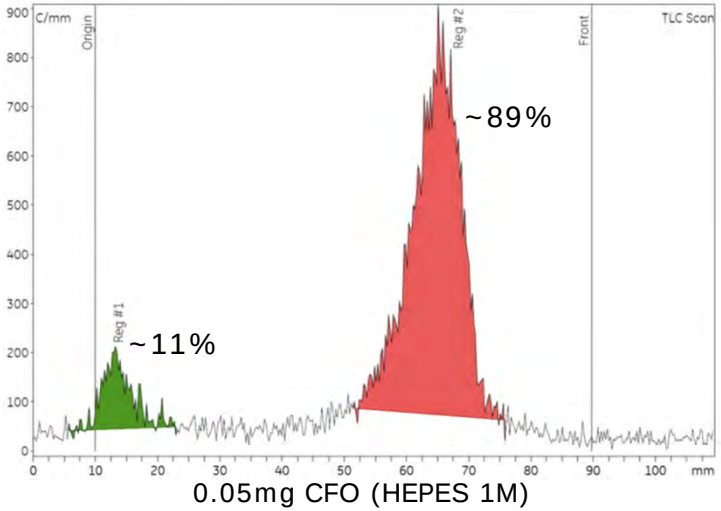
Radiochemical conversion (RCC)



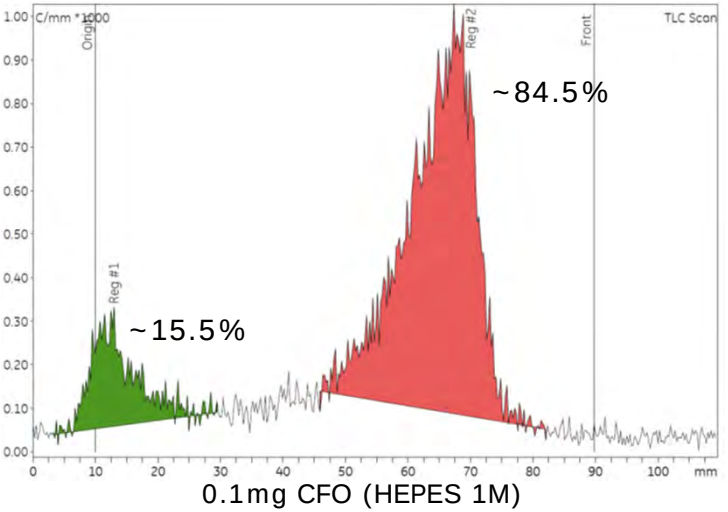
0.05mg S2 (H_2O)



0.1mg S2 (H_2O)



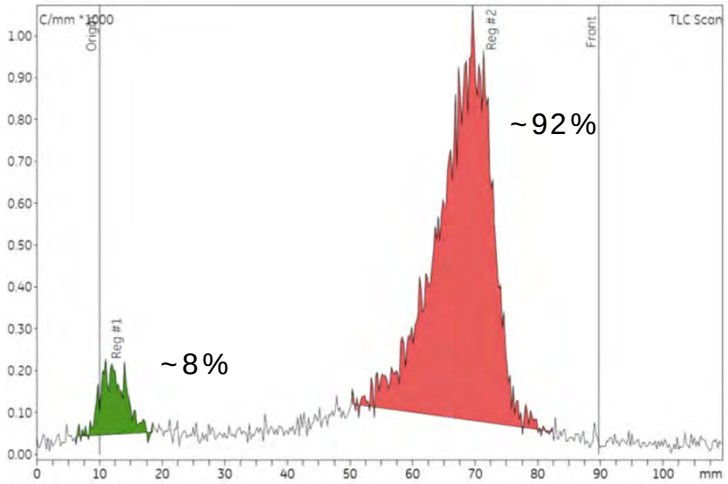
0.05mg CFO (HEPES 1M)



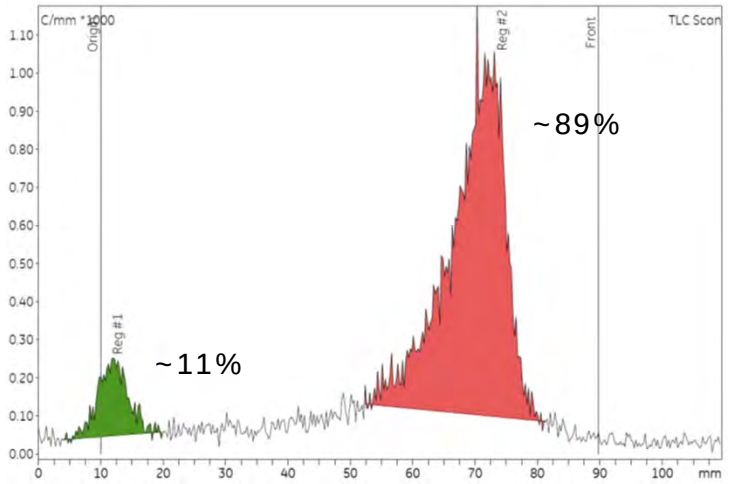
0.1mg CFO (HEPES 1M)

QC of radiolabeled CNHs

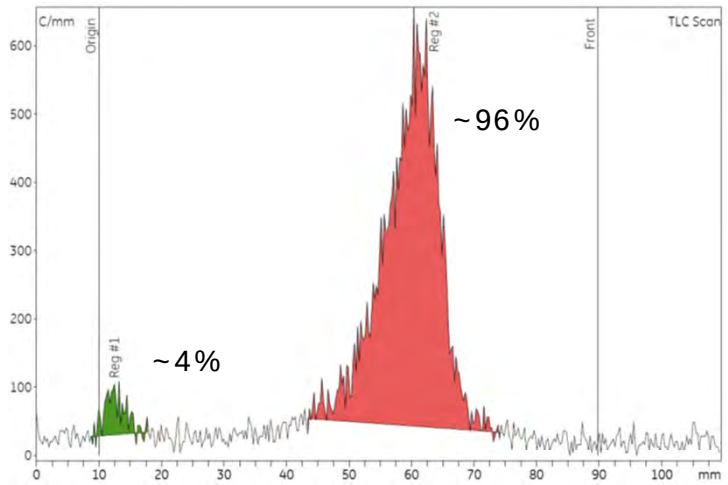
Radiochemical conversion (RCC)



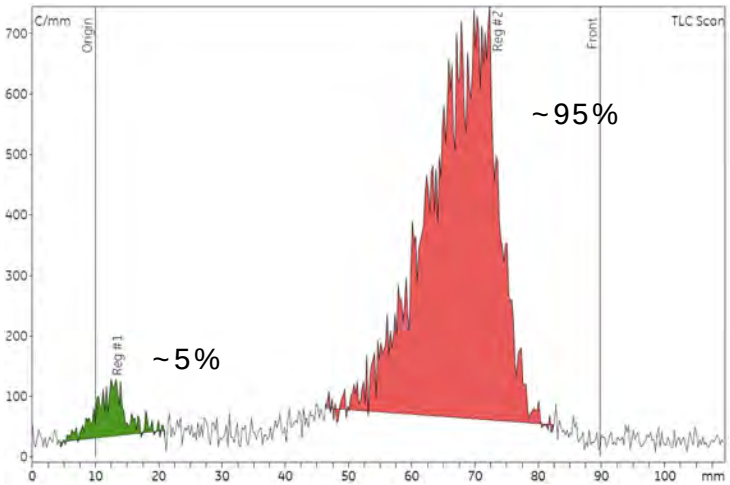
0.05mg CDF19 (H_2O)



0.1mg CDF19 (H_2O)



0.05mg CDF19 (HEPES 1M)



0.1mg CDF19 (HEPES 1M)

QC of radiolabeled CNHs
Radiochemical conversion

BIOEMTECH

Findings

- Radiochemical conversion up to ~54% (for S2)
- Low radiochemical conversion for the other CNHs (~3% - 15.5%)
- CNH dilution buffer & amount of CNHs affect radiolabeling

What is needed

- Optimization of the $[^{68}Ga]GaCl_3$ label protocol (pH, buffer ect.)
- Label nanomaterials with $[^{111}In]InCl_3$ for SPECT imaging

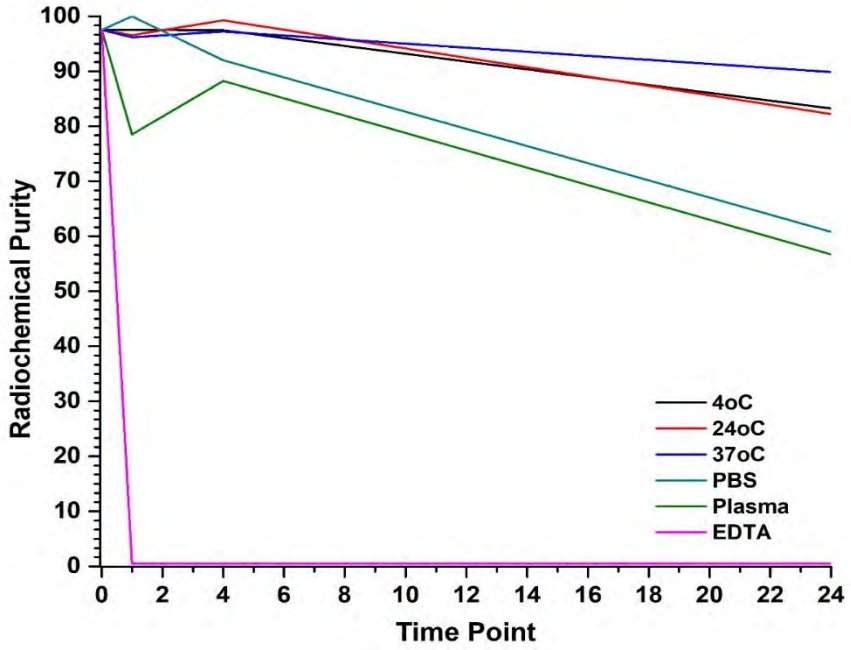
Next step

- Perform kinetics stability (temperatures, buffers)

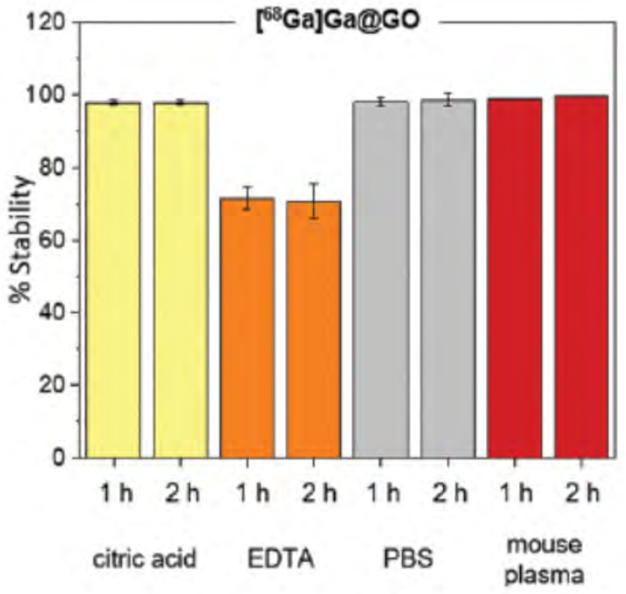
QC of radiolabeled CNHs
Kinetic Stability Assays

BIOEMTECH

Aliquots of the reaction mixture were taken and incubated at different temperatures and different solvents
Radio-TLCs were taken at 1hr, 4 hrs and 24hrs post preparation.



Comparative diagram probing the potential *in vivo* stability of the **radiolabeled-NHs** at three time points post-preparation (p.p.) under various incubation conditions (PBS, EDTA, Plasma).



What's next

BIOEMTECH

If :

- RCC ≤ 95%
- Low stability over time

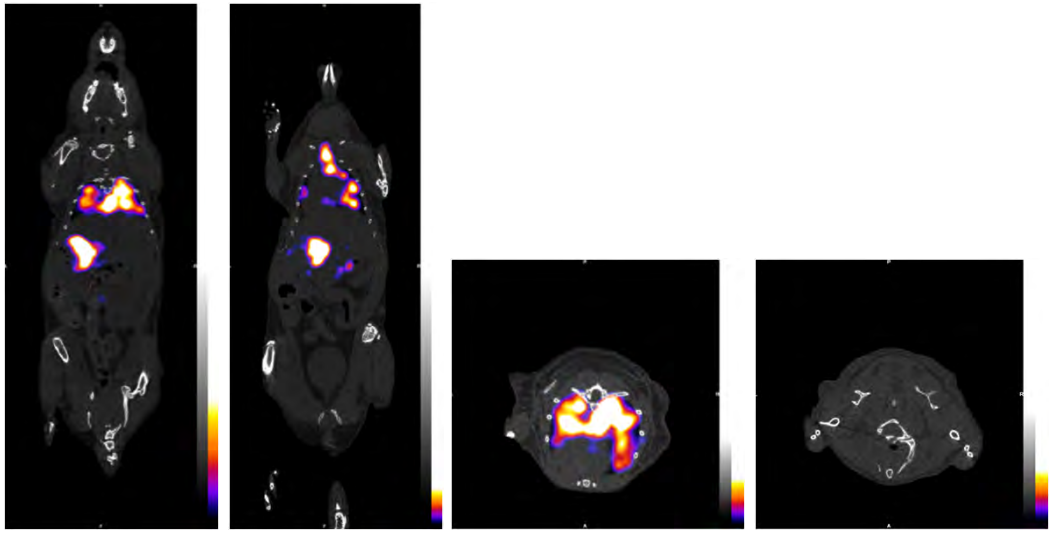
Then:

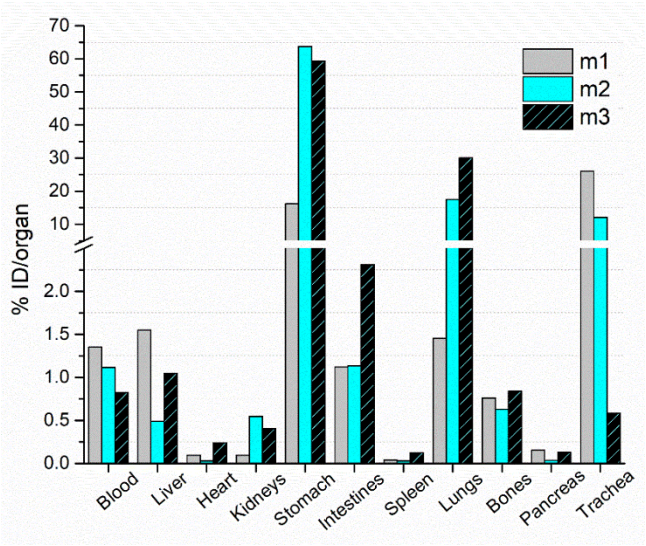
Return to nanomaterial preparation to improve characteristics and performance

- RCC ≥ 95%
- Stable over time

In vivo administration

- Imaging studies
- Biodistribution studies





BioEmission Technology Solutions

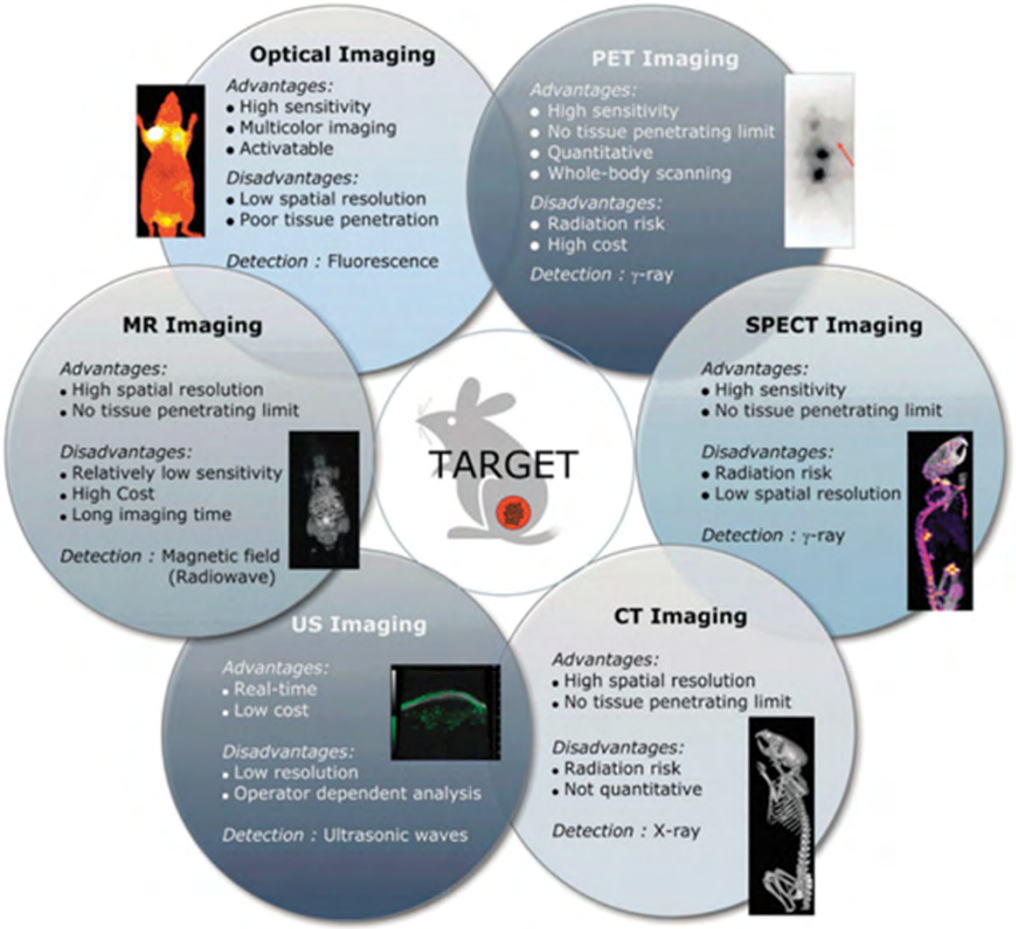
Our Imaging Platform

Small animal imaging

BIOEMTECH

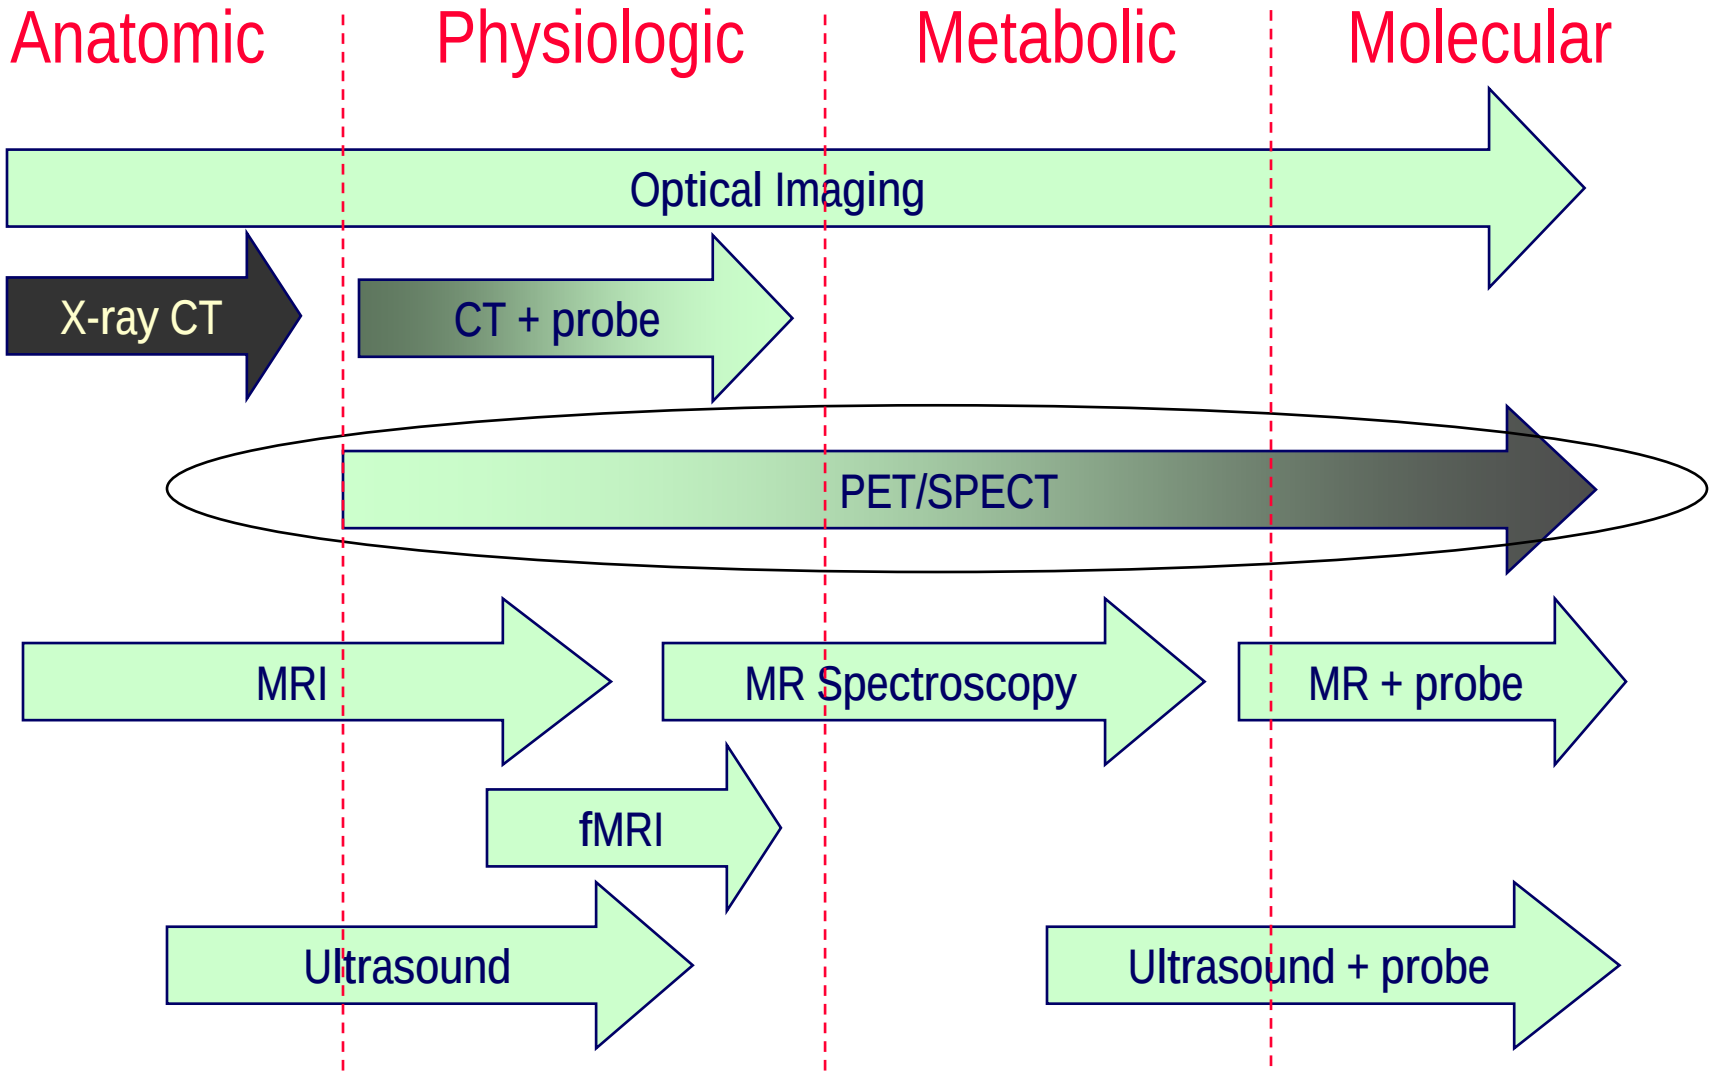
- In vivo ≠ In vitro
- Non-destructive. Repeated studies in the same animal
- Each animal serves as its own control
- We can efficiently image the entire animal simultaneously
- Imaging bridges the gap from cell to human studies
- Many potential targets
- A large variety of imaging techniques available



A Molecular Imaging Primer: Modalities, Imaging Agents, and Applications, Michelle L. James and Sanjiv S. Gambhir, Physiological Reviews, Vol. 92, No. 2, 01 Apr 2012.

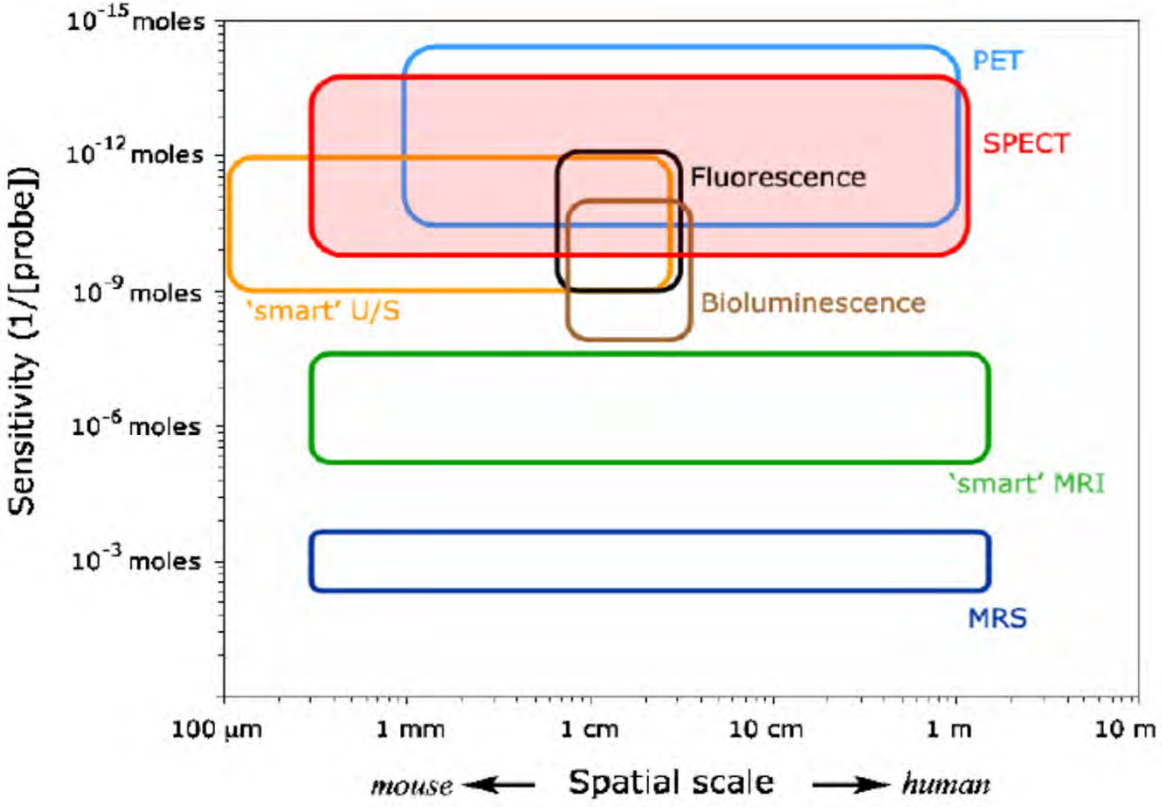
Imaging modalities

BIOEMTECH



Imaging modalities

BIOEMTECH



SPECT is among the most sensitive of the molecular *in vivo* imaging technologies and its spatial scale spans the resolution required for imaging small laboratory animals and the depth penetration required for imaging humans.

Comparison of imaging technologies

BIOEMTECH

Technique	Resolution	Sensitivity	Depth	Time
MRI	10-100μm	μ-mMol	No limit	Min
CT	50μm	m-cMol	No limit	Sec
US	<50μm	mMol	mm	Sec
PET	1-2mm	p-nMol	No limit	Min
SPET	< 1mm	p-nMol	No limit	Min
FRI	1-2mm	p-nMol	< 1cm	Sec
FMT	1-2mm	p-nMol	< 10cm	Sec

Questions for in vivo imaging

BIOEMTECH

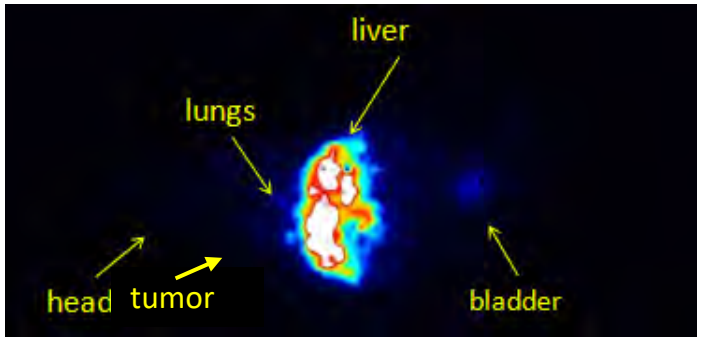
In-vivo imaging provides an answer to the following questions:

- ✓ Do nanoparticles reach the target?
- ✓ Are they concentrated in other organs/tissues?
- ✓ How long do they remain on the target?
- ✓ How long do they stay in blood circulation?
- ✓ Are they stable post injection?
- ✓ What happens at the first minutes post injection?
- ✓ What is the best injected concentration?
- ✓ How shall we prepare the animals?
- ✓ When is the highest concentration in target?
- ✓ When is the best time point for tomographic imaging?
- ✓ When is the best time for biodistribution points?
- ✓ Which is the best injection route?

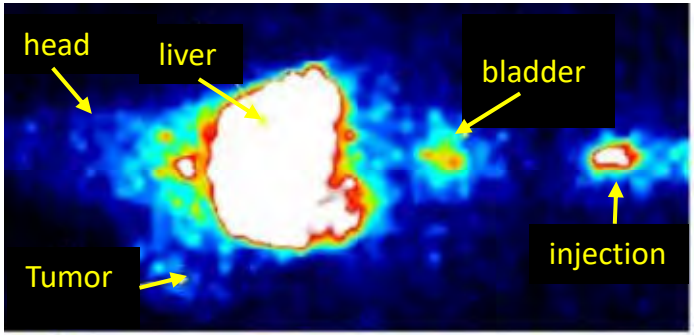
NPs and targeting

BIOEMTECH

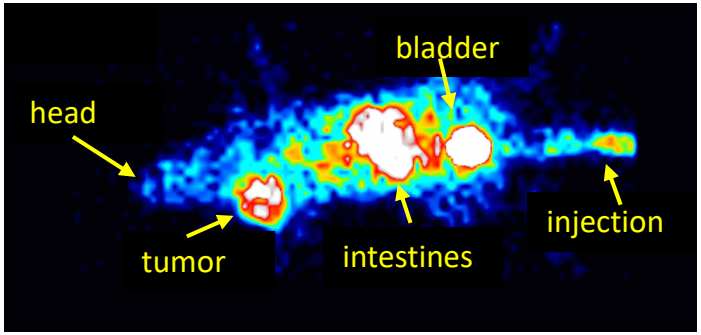
Assesment of **tumor targeting** does **not** need **tomographic imaging** for preliminary assessment



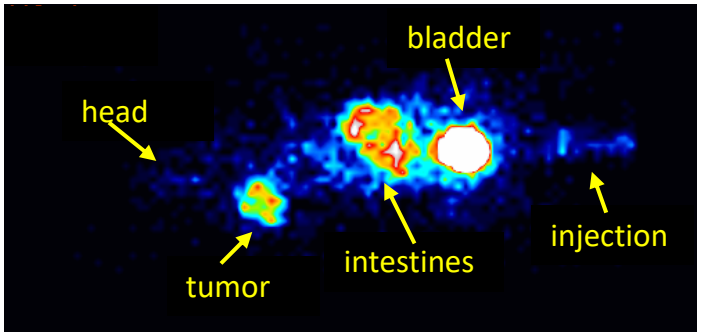
No concentration on tumor



Low concentration on tumor



Good concentration on tumor



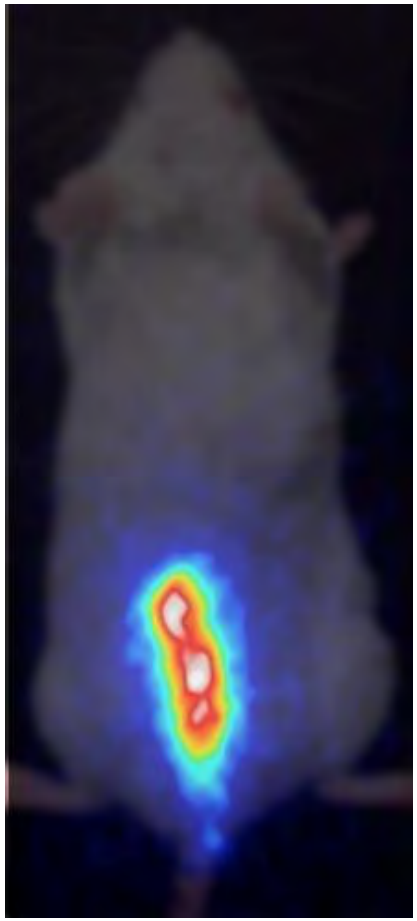
High concentration on tumor

Different administration routes

BIOEMTECH

Retro-orbital

Intra-rectal

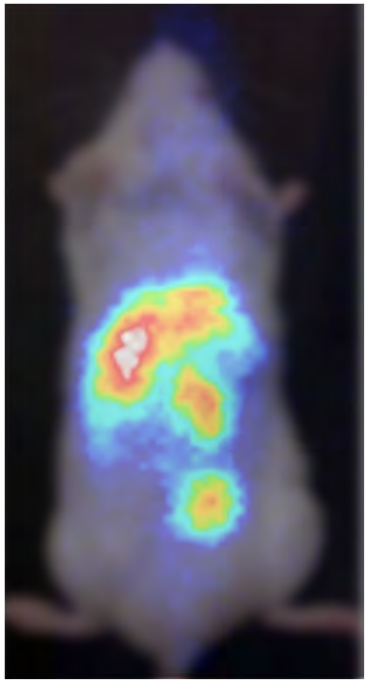


Intra-tracheal

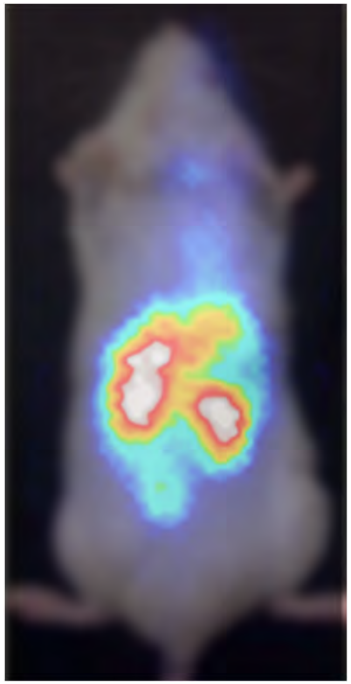
Optimize protocol parameters

BIOEMTECH

Different concentrations

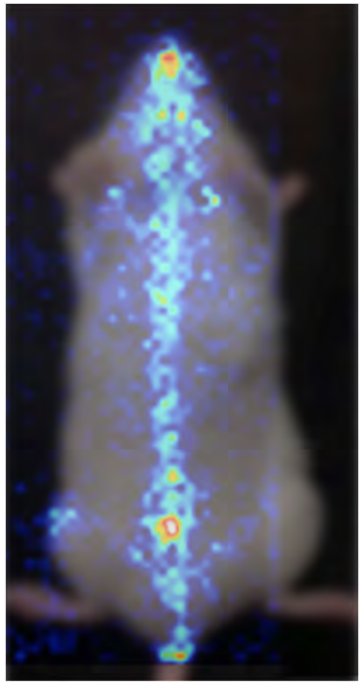


[^{99m}Tc]Tc-MIBI
100uCi
almost no heart signal

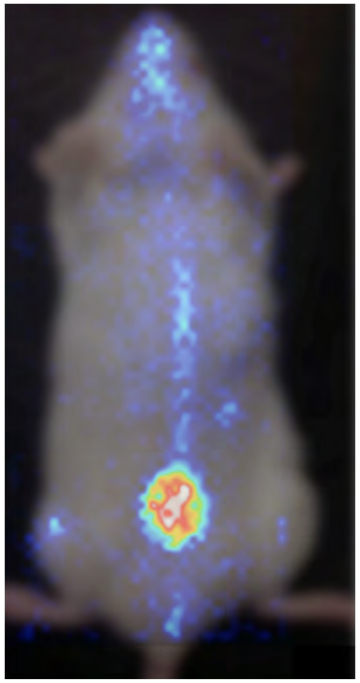


[^{99m}Tc]Tc-MIBI 2mCi
noticeable heart signal

Different preparation conditions



[^{99m}Tc]Tc-MDP after water fasting
Bones clearly visible

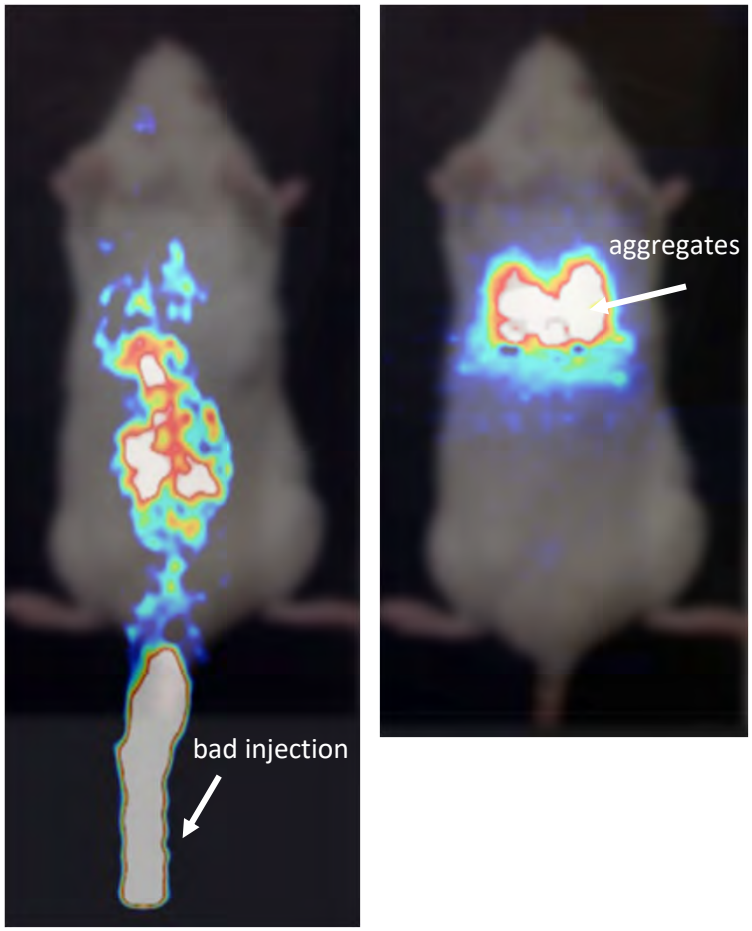


[^{99m}Tc]Tc-MDP under normal feeding conditions – need to "burn" image to see the bones

Identify unsuccessful tests

BIOEMTECH

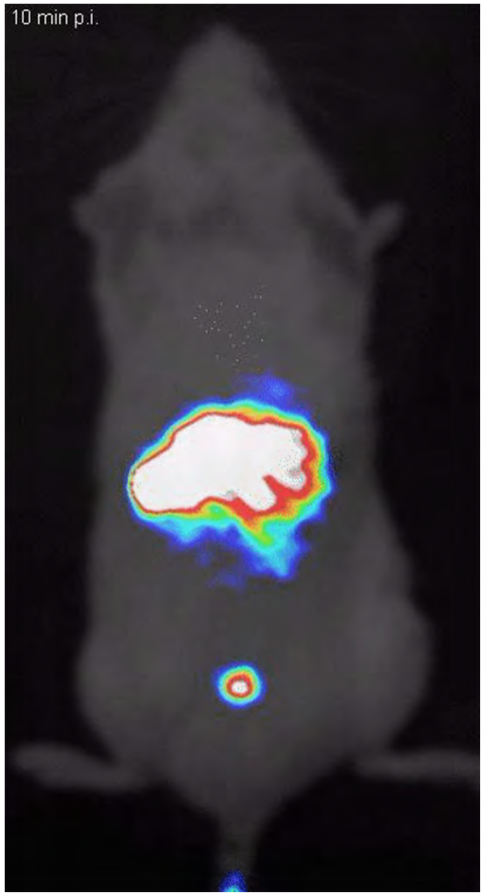
- Image <u>all</u> mice that will participate in a biodistribution study before dissection
- Bad injections can be identified and excluded to improve statistics
- Aggregations or other unexpected concentrations are visible
- **Animals with obvious "errors" are excluded from biodistributions**



Reduction of animals

BIOEMTECH

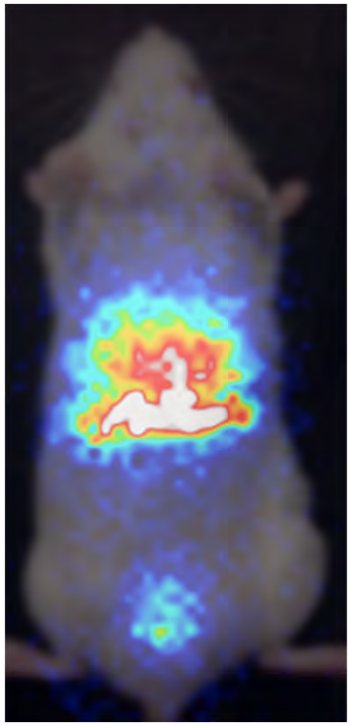
Scan the same mouse easily and fast over multiple time points, with frames down to few seconds. **Full bio distribution data with one animal**



Nanoparticles Biodistribution

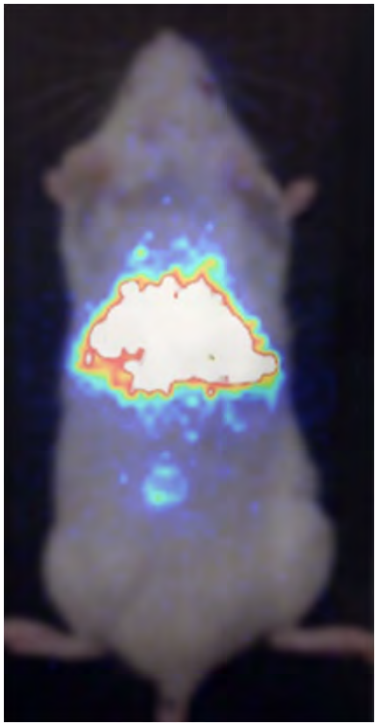
BIOEMTECH

Magnetic Nanoparticles



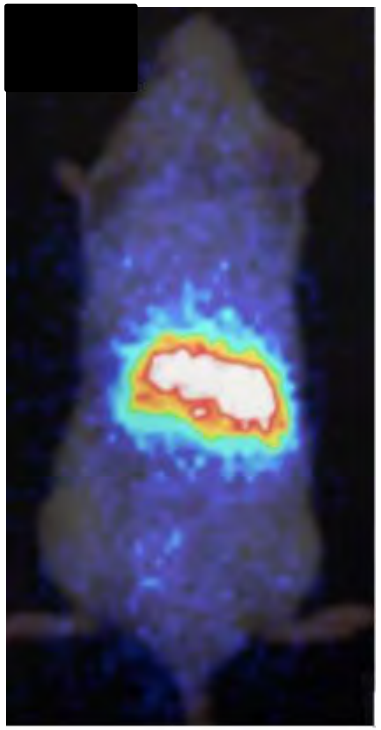
100uCi of [^{99m}Tc]Tc-MDP
in 100ul - 400μg FeCaP
20 min acquisition

Selenium Nanoparticles



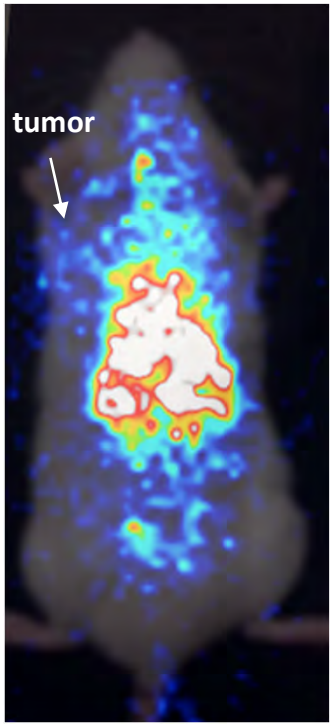
[^{99m}Tc]Tc-PLGA/SeNp
100 ul with 100 uCi
20 min acquisition

Gold Nanoparticles



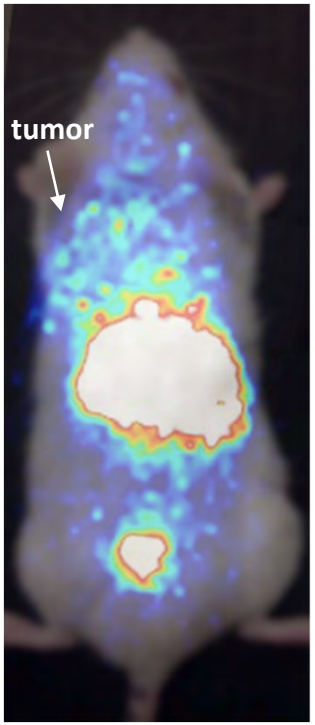
[^{68}Ga] Gold nanoparticles
100 ul with 10 uCi
10 min acquisition

Liposome Nanoparticles



U-87MG mouse, 100 μCi
of [99mTc]Tc-NT Lipo-Cys
20 min acquisition

Silver Nanoparticles



U87MG mouse, Ag-^{99m}Tc (100 μCi)
20 min acquisition

Imaging examples of nanoparticles

BIOEMTECH

Nanoparticles

i. Dynamic imaging of silver NPs

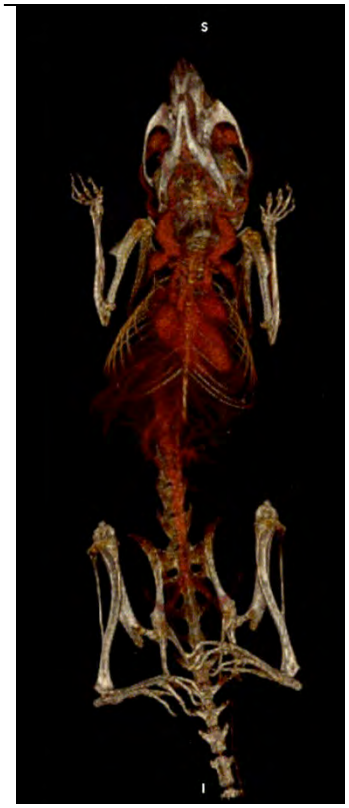
ii. SPECT imaging of magnetic NPs

iii. CT imaging of gold NPs

Indicative preclinical studies

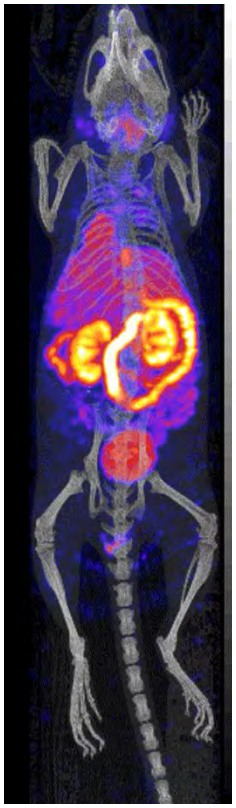
BIOEMTECH

Tumor imaging

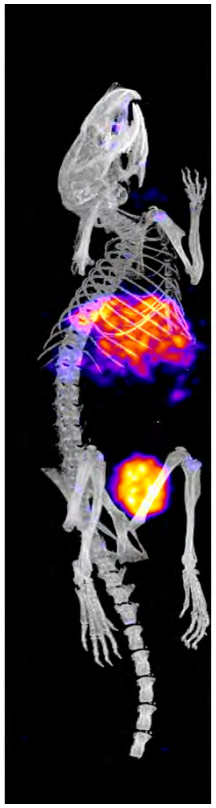


Contrast agents

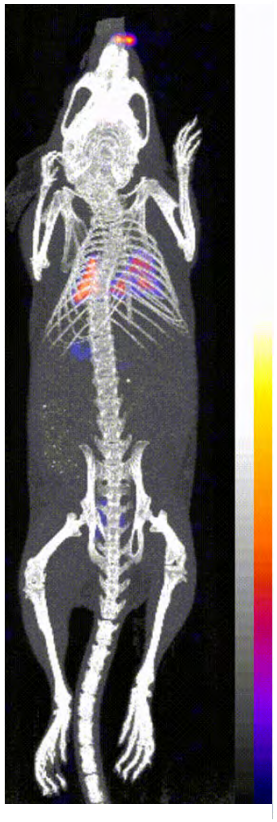
Bone imaging



Cardiac imaging



Nanoparticle imaging



Lung imaging

Imaging examples (I): Oncology

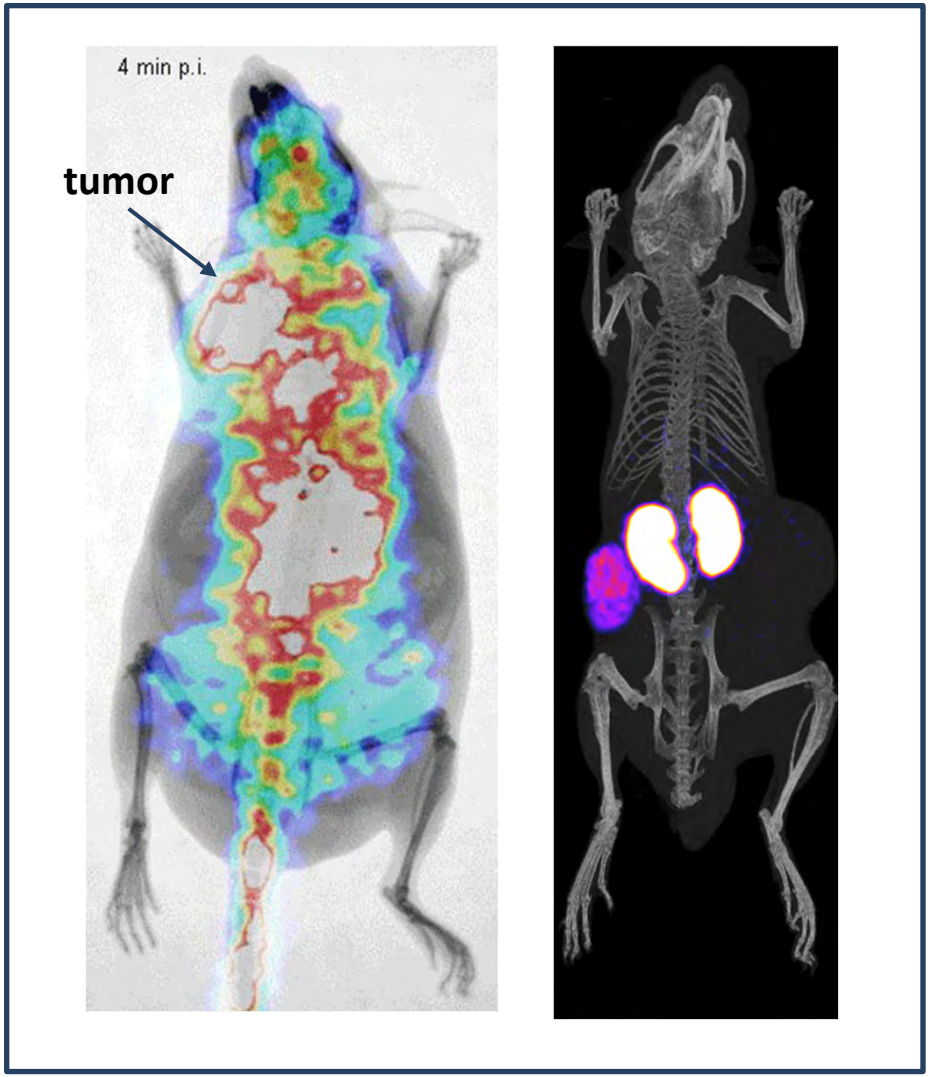
BIOEMTECH

Tumor imaging

Tumor bearing mouse i.v. injected with 100 uL. 1mCi [^{99m}Tc]Tc-peptide:

i. Dynamic imaging for the first 2 hrs p.i.

ii. 3D SPECT imaging @ 4 hrs p.i.



Imaging examples (II): Lungs

BIOEMTECH

Lung imaging

Normal mouse and intra-tracheal administration:

a) Dynamic imaging: 1 hr p.i.

b) Imaging @ 1 hrs p.i.

Conclusions

BIOEMTECH

- Radiolabeling of the nanoparticles may be tricky
  - There are lot of parameters to be taken into consideration.
- Imaging technologies are powerful tools for evaluating the biodistribution of different nanoparticles.
  - They provide unique non invasive tools for repeated studies over time
- It is important to understand the advantages of each imaging technology as well as the properties of different nanoparticles
